AIRFLOW

turns the goal into jobs

AGENT TASKS

make one checked change

SANDBOXES

contain commands + files

Craft: C $\rightarrow$ Rust, run as an Airflow DAG.
Isolated sandboxes. A \$120 budget.

THE EXPERIMENT

Airflow mapped the rewrite into jobs.

Each job built and tested in its own sandbox.

C · ORIGINAL

RUST · REWRITE

ZOZO123.GITHUB.IO/CRAFT ↗

EVIDENCE YOU CAN SEE

The same world, scene for scene.

GROUND LEVEL · HUD, HELD BLOCK, CROSSHAIR

C ORIGINAL

RUST PORT

DUSK · SAME LIGHT FALLOFF CURVE

C ORIGINAL

RUST PORT

Same scene. Same input. Same behavior.

Software work has a price tag now.

INV-CRAFT-RUST-001

Airflow runs the path from a goal to a verified PR.

You provide the repository, acceptance checks, and budget.

Every task result names its input commit and carries evidence into the final integration.

An agent task is one worker—not the factory.

A loop can solve a task. Airflow governs the project.

Every worker gets a contract—and returns evidence.

A clear contract makes agent work governable.

Tasks make changes. Airflow controls the workflow.

PREPARE → EXECUTE → INTEGRATE → PUBLISH

AGENT TASK

edit · build · test

CHECKS

tests · logs · policy

AIRFLOW DAG

schedule · retry · gate · record

Checks gate integration and publish.

Three agent tasks produced three checked patches.

START COMMIT + \$120 → 3 AGENT TASKS → 3 PATCHES + CHECKS

JOIN IN ORDER → FULL TESTS → MERGED PR + RECEIPT

Split the goal into three tasks.

Each task has a commit, dependencies, a budget, and tests.

Run a task after its dependencies pass.

Run each task in a clean sandbox.

Each task gets separate files and build state.

Save each patch with its source commit.

Join the patches in a clean branch.

Apply one patch. Build. Test. Repeat.

Conflicts become repair tasks or approval gates.

AgentOperator connects Airflow to the sandbox.

Airflow schedules the task. SandboxBackend runs commands and files.

Task output: patch + checks + usage

Run SandboxBackend locally, hosted, or in your cloud.

Crabbox routes each task to the selected backend.

The Airflow DAG stays unchanged.

N work items become N mapped tasks.

Prepare, map, join, publish.

More work adds mapped tasks. The DAG stays the same.

One project pattern becomes a software factory.

Start with one checked change. Repeat across projects and teams.

THE ASK

Bring a production sandbox backend.

MODELS WRITE CODE. AIRFLOW RUNS THE FACTORY.

STARTING COMMIT → MAPPED TASKS → PATCH + PROOF → VERIFIED PR
